

# Apple Trials

## Objective

To evaluate Boreal Agromineral in field condition as source of nutrient for **Apples** and record vegetative parameters as well as yield.

Type of Trial:	Bulk field trial.
Area in Sq. mtr:	4000(approx. in acre)
Trees treated with SRC:	Approx. 125
Application Type:	Spot application along the drip line.

## Treatment Details

Considering there are approximately 125 apple trees per acre, we have devised a formula of dosage that needs to be applied per tree for spot application.

Application rate will be **3 KGS per tree along the drip line**. (This has been derived considering 1000 kilogram per acre application rate as broadcast method).

The number of trees samples should be random and the number of trees sampled between the standard practice and Boreal Agromineral application should be the same for a fair test.

## Conclusion

The area where Boreal Boreal Agromineral is used, the trees are performing better and are handling stress better than other trees. Leaves are in better shape than the other trees. Clearly trees are in some better health. When compare to Pervious years the treated area has given better crop (Value for money) and the trees are in better health.
